

I am very much in favor of RM-10352 for the division of the 160 meter band to provide separate areas for CW and SSB (phone) operation. This segmentation works well for all other HF bands and with increased activity on 160 meters will help to insure that the interests of users of both modes are respected. It will eliminate unnecessary interference and provide legal basis rather than simply a "suggested band plan" for managing operation on the band to minimize interference.
